# DISTRIBUTION OF SEATS IN THE EUROPEAN PARLIAMENT IN ACCORDANCE WITH THE PRINCIPLE OF DIGRESSIVE PROPORTIONALITY 

Katarzyna Cegiełka

#### Abstract

Division of mandates to the European Parliament has been regulated in the Lisbon Treaty, according to which seats are allocated according to the principle of digressive proportionality. The terms of the new rules are associated with large differences in the population of the European Union countries, which have taken place since the inception of the Union. Despite the fact that the new rule has been in force since 2009, in the paper the author has shown that the divisions existing in previous terms of office of the European Parliament also complied with the new assumptions.

Keywords: European Union, European Parliament, degressive proportionality, fair division, indivisible goods.

JEL Classification: D39.

## 1. Introduction

The European Parliament is nowadays one of the most important European Union institutions. Its functions include, inter alia, the adoption of European laws and supervision of institutions and the Union Budget. However, its main task is the representation of nationals of the Member States. An important problem is therefore the choice of appropriate procedure for allocating the number of seats to individual countries. Over the decades of functioning of the European Parliament no explicit formula which could be the basis for their division has been determined. It was twice attempted to formulate rules on the allocation of seats, however, they were never strictly applied and every time it was necessary to negotiate. More detailed rules for selecting the composition of the European Parliament were included in the

[^0]Lisbon Treaty which came into force on 1 December 2009. It introduced the concept of digressive proportionality, which for the first time approximates the structure of the division of seats and features that should characterize it.

The article presents the principle of digressive proportionality and the reasons for its introduction. Additionally, it verifies the compliance of division of seats in consecutive parliamentary terms with the binding rule.

## 2. Degressive proportionality

According to Article 1 Point 15 of Lisbon Treaty, Article 9a is added to the Treaty on European Union. Its Paragraph 2 reads:

The European Parliament shall be composed of representatives of the Union's citizens.

They shall not exceed seven hundred and fifty in number, plus the President. Representation of citizens shall be degressively proportional, with a minimum threshold of six members per Member State. No Member State shall be allocated more than ninety-six seats. (Treaty of Lisbon)

The Treaty explicitly points out degressively proportional form of representation of citizens. Nevertheless, it does not define the rule - Article 9a only introduces a new concept. Further description of digressive proportionality was included in the Report of the Committee on Constitutional Affairs and the European Parliament Resolution, the draft of which is attached to the Report. According to Article 1 of Annex 1 of the European Parliament Resolution on the composition of the European Parliament (Lamassoure, Severin, 2007):

The principle of degressive proportionality provided for in Article [9a] of the Treaty on European Union shall be applied as follows:

- the minimum and maximum numbers set by the Treaty must be fully utilised to ensure that the allocation of seats in the European Parliament reflects as closely as possible the range of populations of the Member States;
- the larger the population of a country, the greater its entitlement to a large number of seats;
- the larger the population of a country, the more inhabitants are represented by each of its Members of the European Parliament.

The Report of the Committee on Constitutional Affairs contains additional rules characterizing digressive proportionality (Lamassoure, Severin, 2007):

- The principle of efficiency - limitation of the maximum number of deputies to 750 results from the impossibility of the functioning of the European Parliament with too many members.
- The principle of national representation and motivation of voters - granting each Member State a minimum number of seats allows appropriate representation of national political trends and mobilizes a country's citizens to vote and participate in the democratic processes of the European Union
- The principle of European solidarity - granting more populated states fewer seats than they would receive using a proportional allocation allows better representation for less populated states.
- The principle of the relative proportionality - the smaller is the ratio of population to the number of seats, the smaller is the state and respectively greater, the greater the state is.
- The principle of fair distribution - no country will be given more seats than a state with a larger population and fewer than a less populated state.
- The principle of the justified flexibility or of a flexible direct proportionality - the number of granted seats can be modified if it levels out to the largest possible extent the differences between countries and other rules are followed.

The principles mentioned in the Report and the European Parliament Resolution allow to specify degressively proportional distribution conditions. For $n$ being the number of Member States, $l_{i}$ - population of the country $i$ and $m_{i}$ - the number of mandates of the country $i$ one can write them as follows:

$$
\begin{array}{ll}
\text { W1. } \sum_{i=1}^{n} m_{i}=750,6 \leq m_{i} \leq 96, \\
\text { W2. } & l_{1}<l_{2}<\ldots<l_{n} \Rightarrow m_{1} \leq m_{2} \leq \ldots \leq m_{n}, \\
\text { W3. } & l_{1}<l_{2}<\ldots<l_{n} \Rightarrow \frac{l_{1}}{m_{1}}<\frac{l_{2}}{m_{2}}<\ldots<\frac{l_{n}}{m_{n}} .
\end{array}
$$

It is possible to construct a number of proposals for the composition of the European Parliament, as there still has not been specified a universal formula or algorithm. Defined conditions cause, however, that one can check compliance of the division with the principle of digressive proportionality.

## 3. Proportional division

The third condition of the principle of digressive proportionality says that MEPs from countries with a higher population represent more citizens than the Members from countries with lower population. Distribution of seats in the European Parliament is therefore not based on proportional allocation methods, whose purpose is to assign to each mandate equal number of voters. This is due to a large diversity of the Member States because of the number of their population. For example using the Jefferson method ${ }^{1}$ (Young, 2003), for 750 seats to be divided, two smallest countries - Malta and Luxembourg - would not receive any mandate and Germany would have about 30 more than the second largest, France. On the other hand, wanting to ensure the smallest state a minimum number of 6 seats the size of the European Parliament would exceed 7000 MEP's. Therefore the use of proportional allocation methods is impossible - countries with the lowest population density must be guaranteed the appropriate role of decisionmaking and the efficient functioning of the European Parliament requires limiting the number of Members.

## 4. Compliance of divisions with the degressive proportionality rule

The first term of the European Parliament, when MPs were for the first time elected by universal direct suffrage, began in 1979. The European Union was then composed of nine member states, including Luxembourg and Germany, whose population was respectively 360,000 and 61.5 million citizens. Differences in the population which prevented the use of proportional methods of distribution of seats therefore occurred in the first parliamentary term. They also took place in the next one and seats were allocated in a way different from proportional methods - larger countries always represented a greater number of voters. It was not until the Lisbon Treaty enrolled the principle of digressive proportionality whose conditions allow the verification of the composition of the European Parliament in consecutive terms and whether, despite the fact that it has been valid from 2009, the prior divisions complied with it.

[^1]Tables 1-4 show the structure of the European Parliament in its first four terms in office. In the first two columns countries are arranged in ascending order in terms of population. In the third and fourth column there have been examined two conditions of digressive proportionality:

$$
\begin{aligned}
& \text { W2: } l_{1}<l_{2}<\ldots<l_{n} \Rightarrow m_{1} \leq m_{2} \leq \ldots \leq m_{n}, \\
& \text { W3. } l_{1}<l_{2}<\ldots<l_{n} \Rightarrow \frac{l_{1}}{m_{1}}<\frac{l_{2}}{m_{2}}<\ldots<\frac{l_{n}}{m_{n}} .
\end{aligned}
$$

The first condition, determining the total number of MPs to 750 , was omitted because it takes into account the composition of the present Union, that is with 27 member states. In the earlier terms of the Parliament the composition of European Union included a smaller number of countries, and thus the European Parliament and the number of members sitting in it were lower. In addition, at each new accession, the number of MPs was changed.

The composition of the first four parliamentary terms met the conditions of digressive proportionality. Countries with a higher population density did not have fewer seats and represented more citizens than countries with a smaller population, so that with the increase in population the number of mandates did not decrease (W2) and the ratio of population and number of mandates increased (W3).

Table 1. Compliance of division of seats in the EP with the principle of digressive proportionality 1979-1984

| Composition of European Parliament 1979-1984 |  |  |  |  |  |  |  |

During the fifth parliamentary term the biggest enlargement of the Union took place. In 2004, when Poland joined the EU, the number of Member States increased from 15 to 25 , and the composition of the Parliament for the first time did not fulfil the conditions of digressive proportionality. Table 5 shows the distribution of seats in Parliament between 1999-2004.

Division being in force in 2004 did not meet any of the conditions of digressive proportionality. Slovakia received a smaller number of seats than less populated Finland. Members from five other countries highlighted in the table represent a smaller number of citizens than members from countries with fewer voters.

The composition of the European Parliament between 2004-2009 also was not consistent with the principle of digressive proportionality. But unlike the previous term, only the third condition was not satisfied - so at the beginning and end of the term, Luxembourg, Latvia, Hungary and Italy represented too few citizens. The division of the sixth parliamentary term is presented in Table 6.

The current term of office of the European Parliament began in 2009. In 2007, the Committee on Constitutional Affairs submitted a Report containing a project of Resolution approximating the principle of digressive proportionality. It also included a proposal for allocating seats for the seventh term of office of Parliament. It was consistent with the principle of digressive proportionality,
but too late for ratification of the Treaty, which entered into force in December 2009, thus after the elections to the European Parliament, it meant that the proposal was not accepted. The current composition of Parliament was thus based on a division contained in the Treaty of Nice. The summary of the two divisions is presented in Table 7.

The proposal contained in the resolution meets the conditions of digressive proportionality. It therefore appears that if the Lisbon Treaty came into force before European Parliament elections, the current distribution of seats would be the first, since 2004, division compatible with the principle of
digressive proportionality. The proposal, however, was prepared in 2007. Its creators rely therefore on demographic data from 2006 - the only most up-to-date at the time. After comparing the proposed distribution with the data from 2009 - hence the year in which began the seventh term of Parliament - it turns out that it does not meet the conditions of digressive proportionality.

Table 8 shows the existing and the proposed composition of Parliament for the demographic data from 2009. The table shows the states for which the third condition of digressive proportionality was not accomplished. It took only three years for the division compatible with the principle of digressive proportionality to no longer meet its conditions.

## 5. Conclusions

The differentiation of population of EU Member States means that the proportional methods of seat allocation for the European Parliament cannot be applied. Officially, since 2009, the allocation of seats should be in accordance with the principle of digressive proportionality. The composition of Parliament, however, met its conditions - despite the absence of formal guidelines - already in the first of its cadences. The permanent enlargement of the EU, however, resulted in the fact that the separation of a certain number of seats for many countries in accordance with the terms of digressive proportionality is not an easy task. Ongoing demographic changes inhibit it even further. The division compliant with the principle in a given year may not be one in subsequent years. Undoubtedly, the problem would be solved by the determination of a particular mathematical formula, so the process of selecting the composition of the European Parliament would be more transparent.

[^1]:    ${ }^{1}$ Jefferson's method is the so-called divisor method which consists of dividing the population of each Member State by the same positive number. The result obtained is rounded to the integer. If the total number of seats is lower/greater than presumed, the divisor should be decreased/increased.
