# Use of computer algebra system for recalculation of the fifth-order aberrations of GRIN media 

Leon Magiera

Institute of Physics, Wroclaw University of Technology, 50-370 Wrochaw, Poland.

#### Abstract

The methodology of calculation of the fifth-order aberrations of gradient-index (GRIN) media by application of computer symbolic calculations (computer algebra) is presented. The software package applied was REDUCE. The results obtained enabled us to correct the results known from the literature. The designed computer program has also been added. A special computer program has also been designed.

## 1. Main points of the theory

The procedure for evaluating the fifth-order abberations of GRIN media has been described by GUPTA et al. [1]. Unfortunately, a few of the coefficients derived there are incorrect. The aim of this paper is to demonstrate how to apply computer algebra soft ware for calculations of aberrations of GRIN media. For simplicity, let us recall the main points from Gupta's paper.

The optical ray path is described by the well known Hamilton's equations [1]:

$$
\begin{array}{ll}
\dot{X}=2 P \frac{\partial \mathrm{H}}{\partial V}, & \dot{P}=-2 \bar{X} \frac{\partial \mathrm{H}}{\partial U}  \tag{1}\\
\dot{Y}=2 Q \frac{\partial \mathrm{H}}{\partial V}, & \dot{Q}=-2 Y \frac{\partial \mathrm{H}}{\partial U}
\end{array}
$$

where $X$ and $Y$ denote transverse coordinates of the ray and $P$ and $Q$ are their optical direction cosines corresponding to the $x$ and $y$ axes, respectively. The dot placed over any function symbol indicates differentiation with respect to $z\left(X=\frac{\mathrm{d} X}{\mathrm{~d} z} \ldots\right)$. Coordinate $z$ is measured along the axis of symmetry. Further, $U=X^{2}+Y^{2}, V=P^{2}+Q^{2}$ and $H$ denotes Hamiltonian, which has the following simple form derived by LUNEBURG [2]:

$$
\begin{equation*}
\mathrm{H}=-\sqrt{n^{2}(U, z)-V,} \quad(n-\text { refractive index }) \tag{2}
\end{equation*}
$$

Expanding $X$ and $P$ in ascending powers of ray parameters we obtain

$$
\begin{align*}
& \dot{X}=\dot{X}_{1}+\dot{X}_{3}+\dot{X}_{5}+\ldots  \tag{3}\\
& \dot{P}=\dot{P}_{1}+\dot{P}_{3}+\dot{P}_{5}+\ldots
\end{align*}
$$

where the subscript $i$ denotes the $i$-th order term. In Equations (3) $X_{3}$ and $X_{5}$ are $x$ and $y$ components of the third- and fifth-order aberrations, respectively.

Further expanding Hamiltonian in the Taylor series we get

$$
\begin{equation*}
\mathrm{H}=H_{0}+H_{10} U+H_{01} V+\frac{1}{2} H_{20} U^{2}+\ldots \tag{4}
\end{equation*}
$$

where

$$
H_{i j}=\left.\frac{\partial^{i+j} H}{\partial U^{l} \partial V^{j}}\right|_{w=v=0} .
$$

Now, inserting Eqs. (3) and (4) into Eqs. (1) and equating terms of equal order we get:

$$
\begin{align*}
& \dot{X}_{1}=2 H_{01} P_{1},  \tag{5a}\\
& \dot{X}_{3}=2 H_{01} P_{3}+\tilde{X}_{3},  \tag{5b}\\
& \dot{X}_{5}=2 H_{01} P_{5}+\tilde{X}_{5},  \tag{5c}\\
& P_{1}=-2 H_{10} X_{1},  \tag{5d}\\
& P_{3}=-2 H_{10} X_{3}+\widetilde{P}_{3},  \tag{5e}\\
& \dot{P}_{5}=-2 H_{10} X_{5}+\widetilde{P}_{5} \tag{5i}
\end{align*}
$$

where:

$$
\begin{aligned}
\tilde{X}_{3}= & 2\left(H_{11} U_{1}+H_{02} V_{1}\right) P_{1}, \\
\tilde{X}_{5}= & 2\left(H_{11} U_{1}+H_{02} V_{1}\right) P_{3}+4\left(H_{11} U_{13}+H_{02} V_{13}\right) P_{1} \\
& +\left(H_{12} U_{1}^{2}+2 H_{12} U_{1} V_{1}+H_{03} V_{1}^{2}\right) P_{1}, \\
\tilde{P}_{3}= & -2\left(H_{20} U_{1}+H_{11} V_{1}\right) X_{1}, \\
\tilde{P}_{5}= & -2\left(H_{20} U_{1}+H_{11} V_{1}\right) X_{3}-4\left(H_{20} U_{13}+H_{11} V_{13}\right) X_{3} \\
& -\left(H_{30} U_{1}^{2}+2 H_{21} U_{1} V_{1}+H_{12} V_{1}^{2}\right) X_{1},
\end{aligned}
$$

with:

$$
U_{1}=X_{1}^{2}+Y_{1}^{2}, \quad V_{1}=P_{1}^{2}+Q_{1}^{2}, \quad U_{13}=X_{1} X_{3}-Y_{1} Y_{3}, \quad V_{13}=P_{1} P_{3}+Q_{1} Q_{3}
$$

Aberrations will be expressed in terms of two paraxial rays: an axial one $(h, \vartheta)$ and the field one $(H, \theta)$. These two rays have the following properties:

$$
h\left(z_{0}\right)=0, \quad h(\zeta)=1, \quad H\left(z_{0}\right)=1 \text { and } H(\zeta)=0,
$$

where $z_{0}$ and $\zeta$ localise object and reference planes, respectively. Therefore, for general ray with coordinates ( $x_{0}, y_{0}$ ) and ( $\xi, \eta$ ) in object and reference planes, respectively, we have:

$$
\begin{array}{ll}
X_{1}=x_{0} H+\xi h, & Y_{1}=y_{0} H+\eta h, \\
P_{1}=x_{0} \theta+\xi \vartheta, & Q_{1}=y_{0} \theta+\eta \theta . \tag{6}
\end{array}
$$

Paraxial rays satisfy Hamilton's equations (5a) and (5e). Therefore, for the axial ray, in particular we may write:

$$
\dot{h}=2 H_{01} \vartheta, \quad \dot{\vartheta}=-2 H_{10} h .
$$

The evaluation procedure of aberration $X_{5}$ can be carried out in steps described below. The difference of Eqs. (5b) and (5e) gives

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{~d} z}\left(X_{3} \vartheta-h P_{3}\right)=\tilde{X}_{3} \vartheta-\tilde{P}_{3} h . \tag{8}
\end{equation*}
$$

Hence (8) results in

$$
\begin{equation*}
P_{3}=\frac{\vartheta}{h} x_{3}-\frac{2}{h} I_{1} \tag{9a}
\end{equation*}
$$

where

$$
\begin{equation*}
I_{1}=\frac{1}{2} \int_{x_{0}}^{z}\left(\tilde{x}_{3} \vartheta-\tilde{P}_{3} h\right) \mathrm{d} z . \tag{9b}
\end{equation*}
$$

Inserting Eq. (9a) into Eq. (5b) and integrating the above equation we obtain

$$
\begin{equation*}
X_{3}=h \int_{\zeta}^{\Sigma}\left[-\frac{\dot{h}}{\vartheta h^{2}} I_{1}+\frac{1}{h} \tilde{X}_{3}\right] \mathrm{d} z . \tag{10}
\end{equation*}
$$

Analogically, the difference of Eqs. (5c) and (5f) gives

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{~d} z}\left[X_{5} \vartheta-h P_{5}\right]=\left[\tilde{x}_{5} \vartheta-\tilde{P}_{5} h\right] . \tag{11}
\end{equation*}
$$

As in the paraxial image plane localised at $z_{1}, h\left(z_{1}\right)=0$, the integration of Eq. (11) finally gives

$$
\begin{equation*}
X_{5}=\frac{1}{\vartheta\left(z_{1}\right)} \int_{z_{0}}^{z_{1}}\left[\tilde{x}_{5} \vartheta-\tilde{P}_{5} h\right] \mathrm{d} z . \tag{12}
\end{equation*}
$$

Resuming we see that in order to evaluate aberration $X_{5}$ we have to go through the following steps:

- estimate the refractive index distribution $n$,
- build the Hamiltonian H,
- fix parameters of the ray ( $x_{0} y_{0}, \xi, \eta$ ),
- solve paraxial equations to obtain $h, \vartheta$, and $\theta$,
- evaluate Taylor coefficients $H_{i j} i j$,
- evaluate formulae (9b), (9a), (10) and finally (12).

An analogous evaluation procedure is true for $Y_{5}$.

## 2. Results and conclusions

A computer program for evaluation of the fifth-order aberrations has been designed (see Appendix).

With the help of the program developed, aberrations of the fifth-order have been evaluated for GRIN medium with the refractive index of the form

$$
\begin{equation*}
n=n_{0}\left(1-\frac{1}{2} a^{2} U+\frac{1}{2} b a^{4} U^{2}+g a^{6} U^{3}\right) \tag{13}
\end{equation*}
$$

For this refractive index distribution we have

$$
z_{1}=\frac{m \pi}{a} \quad \text { and } \quad \zeta=\frac{(2 m-1) \pi}{2 a}, \quad(m-\text { natural number })
$$

and aberrations of the fifth-order have the following compact form:

$$
\begin{align*}
X_{5}\left(x_{0}, r, \varphi\right) & =S r^{5} \cos \varphi+\left(B_{1}+B_{2} \cos 2 \varphi\right) x_{0} r^{4}+x_{0}^{2} r^{3}\left(C_{1}+C_{2} \cos ^{2} \varphi\right) \cos \varphi \\
& +x_{0}^{3} r^{2}\left(D_{1}+D_{2} \cos 2 \varphi\right)+x_{0}^{4} r \cos \varphi E_{\text {coeff }}+F x_{0}^{5}  \tag{14a}\\
Y_{5}\left(x_{0}, r, \varphi\right) & =S r^{5} \sin \varphi+x_{0} r^{4} G \sin 2 \varphi+x_{0}^{2} \rho^{3} \sin \varphi\left(H_{1}+H_{2} \cos ^{2} \varphi\right) \\
& +x_{0}^{3} r^{2} P \sin 2 \varphi+x_{0}^{4} r Q \sin \varphi \tag{14b}
\end{align*}
$$

where:

$$
r=\sqrt{\xi^{2}+\eta^{2}}, \quad \varphi=A \sin \left(\frac{\eta}{\xi}\right)
$$

and $S, B_{1}, B_{2} \ldots$ are aberration coefficients. The exact forms of all these coefficients have been extracted from $X_{5}\left(x_{0}, r, \varphi\right)$ and $Y_{5}\left(x_{0}, r, \varphi\right)$ in the following way:

$$
\begin{aligned}
& S=X_{5}(0,1,0), \\
& B_{1}=\left(\frac{\partial X_{5}\left(x_{0}, 1, \pi / 4\right)}{\partial x_{0}}\right)_{x_{0}=0}, \quad B_{2}=\left(\frac{\partial X_{5}\left(x_{0}, 1,0\right)}{\partial x_{0}}\right)_{x_{0}=0}-B_{1}, \\
& C_{2}=\frac{1}{2 \sin ^{2}(\pi / 4)}\left(\frac{\partial^{2} X_{5}(1, r, 0)}{\partial r^{2}}-\frac{1}{\cos (\pi / 4)} \frac{\partial^{2} X_{5}(1, r, \pi / 4)}{\partial r^{2}}\right)_{r=0}, \\
& C_{1}=\frac{1}{2}\left(\frac{\partial^{2} X_{5}(1, r, 0)}{\partial r^{2}}\right)_{r=0}-C_{2}, \\
& D_{1}=\frac{1}{2}\left(\frac{\partial^{2} X_{5}(1, r, \pi / 4)}{\partial r^{2}}\right)_{r=0}, \quad D_{2}=\frac{1}{2}\left(\frac{\partial^{2} X_{5}(1, r, 0)}{\partial r^{2}}\right)_{r=0}-D_{1}, \\
& E_{\text {ceff }}=\left(\frac{\partial X_{5}(1, r, 0)}{\partial r}\right)_{r=0}, \quad F=X_{5}(1,0,1),
\end{aligned}
$$

$$
\begin{aligned}
& G=\left(\frac{\partial Y_{5}\left(x_{0}, 1, \pi / 4\right)}{\partial x_{0}}\right)_{r_{0}=0}, \\
& H_{1}=\frac{1}{2}\left(\frac{\partial^{2} Y_{5}\left(x_{0}, 1, \pi / 2\right)}{\partial x_{0}^{2}}\right)_{r_{0}=0}, \\
& H_{2}=\left[\frac{1}{2 \sin (\pi / 4)}\left(\frac{\partial^{2} Y_{5}\left(x_{0}, 1, \pi / 4\right)}{\partial x_{0}^{2}}\right)_{r_{0}=0}-H_{1}\right] / \cos ^{2}(\pi / 4), \\
& P=\frac{1}{2}\left(\frac{\partial^{2} Y_{5}(1, r, \pi / 4)}{\partial r^{2}}\right)_{r=0}, \quad Q=\left(\frac{\partial Y_{5}(1, r, \pi / 2)}{\partial r}\right)_{r=0} .
\end{aligned}
$$

Comparing all the results obtained with those known from [1] one can easily observe that coefficients: $B_{1}, B_{2}, D_{1}$ and $D_{2}$ are not the same. The correct results should be as follows:

$$
\begin{aligned}
& B_{1}=a^{4} m \pi^{2}\left(\frac{3}{2} b^{2} m-\frac{15}{16} b^{2}-b m+\frac{29}{32} b+\frac{5}{32} m-\frac{55}{256}\right), \\
& B_{2}=a^{4} m \pi^{2}\left(\frac{3}{4} b^{2} m-\frac{3}{4} b^{2}-\frac{7}{8} b m+\frac{1}{2} b+\frac{15}{64} m-\frac{5}{64}\right), \\
& D_{1}=a^{4} m \pi^{2}\left(\frac{5}{4} b^{2} m-\frac{3}{2} b^{2}-\frac{9}{8} b m+\frac{11}{8} b+\frac{9}{64} m-\frac{5}{16}\right), \\
& D_{2}=a^{4} m \pi^{2}\left(b^{2} m-\frac{3}{4} b^{2}-\frac{3}{4} b m+\frac{1}{2} b+\frac{1}{4} m-\frac{5}{64}\right),
\end{aligned}
$$

The remaining coefficients are the same as those published in [1].
An analogous calculation procedure has been extended for seventh-order approximation [3].

Summing up we notice that REDUCE has proved to be a powerful tool for calculation of aberrations of GRIN media [4].
